

A Beginners Guide to The Paleo Diet

It has often been said that change is progress and, in the eyes of many people, change is always for the better. While technological advances and new medical discoveries have shaped modern society, not all of the changes that have occurred over the past several thousand years have been good. Whereas humans used to live simple lives, today's culture is burdened by the desire to own the next big thing or to hop on board with the latest fashion trend. The desire to improve has become a compulsion, a driving need for some people to the point that they are willing to do anything to get it. This obsessive desire for improvement has spilled over into the realm of health and fitness, especially in Western cultures. Fad diets are sweeping the nation and millions of people are making drastic changes to their diets and exercise routines for the sake of achieving the perfect figure. While many see results while following crash diets or exercising obsessively, few realize that though they may have achieved the look they desire, they have not actually become any healthier. In many cases, these diets can actually be detrimental to your health. In cultures dominated by processed foods and diet products, real, wholesome nutrition often seems hard to come by. Many people do not even realize that it is missing from their diets. Looking back to a simpler time, early humans living during the Paleolithic Era were hunters and gatherers. Everything they ate came directly from the earth, procured by their own two hands. Agriculture has only existed for the past ten thousand years or so and the type of agriculture responsible for the production of refined sugars and enriched flours has only existed for about two hundred years. Today it is too easy to simply pull up to the local drive-in, order a burger with fries and call it a meal. Whereas Paleolithic humans dedicated much of their time to hunting and gathering food, people today rarely

have to travel more than a few blocks to find something to eat. In fact, it is possible to construct a diet based on fast food alone without ever setting foot into a grocery store or preparing a meal by hand. Unfortunately, many people choose to adopt this kind of lifestyle and, perhaps as a result, risk factors for serious health conditions have skyrocketed in recent years. In a health survey conducted in 2010, the U.S. Department of Health and Human Services determined that 9% of adults over the age of 18 had been diagnosed with diabetes and 12% were told that they had heart disease. The results of the survey also indicated that 34% of adults over the age of 18 were overweight and 28% were obese. In addition to these health-related findings, the survey also indicated that 53% of adults labeled themselves either inactive or insufficiently active in terms of aerobic activity. The results of this 2010 health survey indicate that significant changes have occurred since the Paleolithic Era not only in terms of technology and agriculture, but also in human lifestyles. The availability of food is taken for granted by many and, because it is no longer necessary to expend much physical effort to obtain food and other resources, many people make very little effort to stay active at all. Both of these factors have combined to result in a significant decline in overall health in modern Western cultures as well as a decreased average lifespan and an increased risk for chronic illness. Though human diets and lifestyles have changed significantly over the past fifteen thousand years, one thing has remained largely unchanged: human genetics. Scientific studies have revealed that the modern human genome is 99.9% equivalent to the human genome from the Paleolithic Era. Bearing this evidence in mind, the dietary changes that have come about over the past several thousand years have not been out of necessity the human body is still capable of subsisting on the same type of diet Paleolithic Era humans followed....
