

Siblings in South Asia: Brothers and Sisters in Cultural Context

Despite the obvious importance of sibling relationships in human development, questions such as these are not readily answerable for a number of reasons: To date, psychologists have not adequately considered the impact of culture on sibling relationships; anthropologists generally have not studied cultural processes as they unfold in individual development; and, perhaps most important, few studies of siblings outside the United States and Britain currently exist. Addressing the issues of greatest concern to psychologists and anthropologists alike, this interdisciplinary volume//m-//including social and structural, developmental psychological, psychoanalytic, and ethnopsychological

perspectives//m-//examines the development of sibling relationships in several different regions. The book opens with an overview of sibling similarities and differences around the world and an introduction to the cross-cultural study of sibling relations. The volume is then divided into two parts. The first focuses on the organization of sibling relations in childhood and adulthood. Chapters analyze the organization of sibling relations as they relate to socialization practices, family economics and structure, and customs of marriage and dowry. The second part of the book focuses on the representation of cultural and psychological meanings of sibling relations through mythology, astrology, and life history. Rounding out the volume is a discussion of how this work contributes to the developmental literature.
