

Labor and Rainfed Agriculture in West Asia and North Africa (Of Ideas; 130)

The basic objective of agricultural research at ICARDA is to enhance producer and consumer welfare through increasing the productivity, stability, and profitability of agriculture. Improved practices must be technically, economically, and socially suitable to farmer conditions. The rainfed areas of West Asia and North Africa have highly variable environmental conditions as well as complex social and economic structures. In recent years, the region has been experiencing major changes in the relative availabilities and costs of the classical factors of production: land, labor, and capital. These changes have important implications for the design of new agricultural technology. On the one hand, the availability of labor may be an important factor determining the acceptability of new technology. On the other, it is important to consider the impact that technology can have on rural employment. To develop a better awareness of these issues and their relevance to technology development, ICARDA initiated a project on Agricultural Labor and Technological Change. The first stage of the project is published here; it is a review of available literature on selected issues of regional importance, combined with more detailed analyses of the situations of eight countries with important rainfed agricultural sectors. ICARDA greatly appreciates the financial assistance of the Ford Foundation, which allowed us to support the execution of the study and publication of its findings. We also appreciate the great efforts of the authors in the face of often limited data and facilities.
