

Human Wildlife Conflict Management: Understanding the fundamentals of human wildlife conflicts in human dominated landscapes

Human wildlife conflicts are a growing problem in many parts of the world. Influential factors include increasing human populations, loss of natural habitat, and, in some regions, growing wildlife populations resulting from successful conservation programs. Conflict can be particularly serious, where rural people live in close association with protected areas. Human wildlife conflict attracts greatest attention when the wildlife species involved is endangered or where the conflict poses a serious threat to human welfare. Human wildlife conflict management is however as complex as human civilization itself, demanding innovation and committed policy changes that favor amicable solutions. Understanding the fundamentals driving the conflict is critical to the development of innovative solutions to this growing problem which if not managed will lead to a lose lose situation. Co-existence between humans and wildlife is a barometer that measures the success of our conservation efforts.
