

# Scoring stocks: An adaptive scoring system for stocks (Debunk Myths in Investing)

Enter the fundamental metric information such as P/E on any 100 stocks into a scoring system. If the top 25% of the stocks perform a lot better than the rest in 6 months consistently, then it is a good scoring system. I have been using my own scoring system for years. It sums up the individual scores for selected fundamental metrics. When the total passes a certain number, evaluate the stock further for potential purchase. This scoring system has been updated many times for refinements and adapting to the changing market conditions. All metric information can be obtained from free or low-cost web sites. Many companies and academic projects must have worked on this kind of stock scoring systems. However, few if any can prove their systems work consistently. I may have found the reason why it does not work consistently. The fundamental metrics change from different market conditions. To illustrate, the current market conditions may favor value while some other conditions favor growth. I monitor the performances of all the fundamental metrics periodically and make changes accordingly. Hence, I call my scoring system Adaptive Stock Scoring System (do not use the acronym). -----  
 Release Notes. I was attacked for recommending AAPL at \$390.05 in April 19, 2013 for after the fact, a common trick by authors. This book was published in early May and I did send the Impact Report on AAPL at that time to a report broker. You can blame me for being lucky. The scoring system worked for AAPL and also for IBM which was the initial example for this book and was not used due to scoring too low. -----
