

Monte Carlo Simulation and System Trading. Chance Evaluation, Risk Analysis and Validation of Mechanical Trading Systems

System trading with mechanical trading systems world-wide determines increasingly the financial market activities of professional and private traders. Unfortunately the current success ratio of such systematic trading, i.e. to trade profitable long-term cannot so far keep up with the risen popularity of this method. Reasons for this are among other things insufficient development processes as well as inadequately tested systems. The additional use of Monte Carlo Simulations during the system development and the system test phases contributes to the fact that chance evaluation, risk analysis and validation of mechanical trading systems can be qualitatively improved clearly. Volker Butzlaff, degree as Engineer for Urban Planning, was active many years as project manager, system designer and quality assurance controller in the Information Technology department of DaimlerChrysler in Germany. Today he works as freelance engineer with the emphasis of system development and simulation methodology.
