

Wireless Phones and Health: Scientific Progress

Since questions about wireless phones and brain cancer were first raised in early 1993, numerous scientific studies and reviews have been conducted and published throughout the world with support from industry and government. The most comprehensive colloquium to date covering this science was co sponsored by the International Committee on Wireless Communication Health Research and Wireless Technology Research, LLC, at the University La Sapienza of Rome in November 1995. Papers from that colloquium with appropriate updates form the foundation for the current volume. A follow up to that colloquium is being planned for the spring of 1999 by the same group and the report of that colloquium will be the basis for Volume II of this series. As the scientific story about wireless phones and health effects continues to unfold over the next several years, it is important to evaluate the work in a context that is beneficial to the enhancement of public health. Two themes are critical to an appropriate contextual understanding of this science.
